

We claim “Reusable” and “Available” badges.

We are releasing a virtual machine of the artifact, and the source code for the artifact as open-source software. The source code is available at <https://github.com/LASER-UMASS/Swami/> along with detailed documentation.

The virtual machine artifact has simple-to-execute scripts that replicate all the results in our paper, making it easy for other researchers to replicate our results, and also to modify the scripts as they see fit to improve on the work. The open-source artifact makes it easy to build on our software.
